

Time-harmonic Maxwell, in-plane E

$$(K - \omega^2 M) e = f$$

lowest-order Nédélec edge elements,

1,504 interior edges at the working mesh

Frequency (sub-resonant)

$$\omega^2 = r \lambda_1 (1 + 0.05 i), \quad r \sim U[0.2, 0.6]$$

λ_1 : first eigenvalue of that instance;

resonance is out of scope

Reference

fine-mesh solution, up to 393k unknowns for the cost and transfer tests
